SUPPLEMENTARY TABLE 1

Sliding-positive ipsilateral finding and same-session contralateral hernia detection at initial bilateral exploration

Panel A. Crude event distribution					
	Same-session contralateral hernia detected		No contralateral hernia detected		
Sliding status	n/N	%	n/N	%	n
Sliding-positive finding	36/38	94.7	2/38	5.3	38
Sliding-negative finding	44/61	72.1	17/61	27.9	61
Total	80/99	80.8	19/99	19.2	99
Panel B. Association estimates					
Model	Effect measure		Estimate	95% CI	*p*
Fisher exact test (unadjusted)	OR for same-session detection (sliding-positive *vs.* negative)		6.95	1.47-65.01	0.0074
Logistic regression (adjusted)	Adjusted OR for same-session detection (sliding-positive *vs.* negative)		5.39	1.08-26.78	0.0395

CI, confidence interval. Restricted to patients undergoing initial bilateral exploration within the unilateral primary cohort (n = 99). Sliding-positive finding denotes ipsilateral sac content containing ovary, fallopian tube, ovary plus fallopian tube, or omentum. The adjusted model included age and side of presentation.
